

## Properties of Polynomials

- It sometimes helps to write a polynomial with the terms in descending order.
- The term with the highest degree indicates the degree of the polynomial as well.
- The **leading coefficient** is the coefficient on the term of highest degree.

Circle the leading term then identify the degree and leading coefficient of the following polynomial:

$$4x^3y^2 - 2x^2y + 3z$$

Degree: \_\_\_\_\_

Leading coefficient: \_\_\_\_\_

## Adding, Subtracting, and Multiplying Polynomials

Use different colors to underline the **like terms** and then add the polynomials together.

$$(3x^2 - x + 2) + (x^2 + 4x - 9) = \underline{\hspace{4cm}}$$

When subtracting polynomials, it is sometimes easier to distribute the negative sign first THEN combine the polynomials.

$$(9r^2 + 6r + 16) - (8r^2 + 7r + 10)$$

(Distribute the negative then color code the like terms!)

$$(9r^2 + 6r + 16) - (\underline{\hspace{1cm}} + \underline{\hspace{1cm}} + \underline{\hspace{1cm}}) = \underline{\hspace{4cm}}$$

When you multiply polynomials, you must distribute like terms:

$$(n^2 + 6n - 2)(n + 4)$$

$$n^2(n + 4) + 6n(n + 4) - 2(n + 4) = \underline{\hspace{4cm}}$$

(Once again, combine like terms to get the final answer!)
